Top Secret - Database entity-relationship diagram

Current implementation snapshot

Each mission has one facility and one or more unique agents, who may belong to any facility. Briefs are optional.

RESTRICT protects facilities/agents. Deleting a mission removes its links and clears briefs.mission_id.

* Blank strings represent optional death date and notes. All stored dates use ISO text.

audit_log content_id is historical and polymorphic, not a foreign key. Credentials remain in a ciphered file.

Inbox: agents.name = username, ignoring case.

See interface-design.txt and content-model.txt for contracts, integrity rules and regression steps.

Editing persistence - existing schema and country handoff

Homework 7 / Member B / Week 1 - design supplement, November 10, 2026

Each facility is assigned one country in the target design. Existing facilities need a migration decision.

Field names, uniqueness, import format and migration/backfill remain A/D handoff decisions.

Member B persistence boundary

Web forms use existing ContentService operations

Brief / agent / facility: add and update

Mission create: addMission(values, facility, agent)

Mission update: update; relationship edits need D API

audit_log <<existing; unchanged by B>>

Model writes CREATE / UPDATE transactionally

event_type, content_type, content_id

username, timestamp; id is the primary key

No web-form table; no duplicate content storage

Week 1 adds no schema migration. Dashed relationship is proposed, not present in the database.

Country rename should display through the FK lookup, never a copied facility country label.

Current complete ERD appears on the preceding page. Session administration belongs to D.
